December 2020**

Special Issue on COVID-19

We invite contributions to a special issue on the impact of the novel coronavirus and its lasting effects for urban forests and urban greening. The issue will include papers ranging from global narratives through to the local consequences of the policies governments have employed to manage the pandemic and how these play-out in the management, provision, location, design and planning of urban forests and urban greenspace now and in the future.

Review Papers, Research Articles, and Short Communications are invited under one or more of the following themes and questions:

Urban forestry and urban green space during the pandemic.

Newly revealed values on urban forests and urban greenspace.

Forward thinking on urban forests and urban greenspace after the pandemic.

For papers to be considered, COVID-19 should be a core theme of the presented study. Case studies are welcomed, but need to have a wider relevance, and their findings have to be related to the international state-of-art.

All papers will be subjected to the regular editorial procedures of the journal. Authors are asked to refer to the journal's [Guide for Authors](#).

There are opportunities for early on-line publication subject to peer review as well as open access. Contact the guest editors for further information.
